NOUMAN SAEED

FULL-STACK SOFTWARE ENGINEER | PYTHON & APPLIED MACHINE LEARNING

London, UK • +44 7832178137 • noumansaeed831@gmail.com • noumansaeed.vercel.app • linkedin.com/in/nouman93

UK full right to work • Available for full-time onsite, London

PROFILE

Full-stack software engineer with five years of experience developing web and mobile applications, including publicly released products. I enjoy understanding how people work, turning unclear requirements into practical features, and staying involved when performance or integration problems arise. Helped deliver RACQY, a sports booking app that reached 1,000+ users before it was discontinued, and led two interns while improving its React Native architecture. MSc Data Science (Merit) graduate with academic Python and machine learning experience; currently building independent marketplace and delivery products.

TECHNICAL SKILLS

Frontend & mobile: JavaScript, TypeScript, React, Next.js, React Native, Expo, React Hooks, Tailwind CSS

Backend & databases: Node.js, Express, REST APIs, GraphQL, MongoDB, Firebase/Firestore, MySQL, SQL

Python & ML: Python, pandas, NumPy, scikit-learn, PyTorch, feature engineering, model evaluation

Tools & integrations: AWS, Git, GitHub Actions, Docker fundamentals, Stripe, Algolia, Google Maps APIs

PROFESSIONAL EXPERIENCE

Web Developer | Creative Networks Limited | May 2025 – March 2026

- Built React/Next.js interfaces and Node.js/Express REST endpoints, connecting frontend journeys to MongoDB-backed application data and business logic.
- Worked from stakeholder requirements through implementation, resolving usability and integration issues and iterating on application performance.

Software Engineer | Enxsys | January 2023 – January 2024

- Developed React Native features for a sports venue booking application, connecting venue discovery, scheduling and real-time availability into practical booking journeys.
- Integrated Firebase authentication and real-time chat, Stripe payments and subscriptions, and Algolia search; handled interconnected user journeys across booking, search and checkout.

Software Engineer | Walqalum | February 2021 – January 2023

- Built React Native applications for iOS and Android, supported releases to Apple App Store and Google Play, and developed Node.js/Express APIs and integrations.
- Implemented logistics barcode scanning and location tracking using Google Maps APIs, alongside deep linking, localisation and social login.
- Worked on RACQY production delivery and maintenance, refactoring performance-sensitive class-based React Native components into functional components using hooks to improve code structure and address app slowdown.
- Led and supported two interns, dividing development work and reviewing implementation choices as the product evolved.

SELECTED PROJECTS & PRODUCT EXPERIENCE

RACQY | Sports booking and social mobile app | Publicly launched; now discontinued

- Shipped to real users and reached more than 1,000 users before the product was discontinued; contributed to booking, discovery and social experiences.
- Worked with a non-technical customer who described familiar LinkedIn, Facebook, Instagram and WhatsApp-style interactions. Helped translate requests into concrete journeys for connections, mutual friends, profile views, chat interactions and stories rather than treating each request as a standalone screen.
- Made a maintainability/performance trade-off by restructuring class-based screens into functional components with React hooks as the app grew; balanced requested features against app responsiveness and long-term complexity.

Pawzys | Founder-led independent pet marketplace | June 2026 – present; in development

- Independently building a pet marketplace from concept through implementation, taking ownership of product decisions, React/Next.js frontend, Node.js/Express APIs, and MongoDB data models.

- Developing authentication, validation, and buyer/seller journeys, with an emphasis on maintainable APIs and clear marketplace workflows; not yet represented as a launched product.

BikeDrop | Independent delivery platform | June 2026 – present; early development

- Designing delivery journeys, order lifecycle, user roles and the API/data model from an initial concept; not yet a launched product.

EDUCATION & ACADEMIC MACHINE LEARNING

MSc Data Science (Merit) | London South Bank University | 2024–2025

- Dissertation: environmental sound classification using the ESC-50 dataset; engineered MFCC and mel-spectrogram features in Python and evaluated CNN, ResNet18, CRNN and transformer approaches with PyTorch.
- Used five-fold cross-validation, confusion matrices and t-SNE; best reported ResNet18 result was approximately 42% accuracy. Academic research, not production AI deployment.

BSc Software Engineering | COMSATS University | 2017–2021

Python AI & Machine Learning Bootcamp | London South Bank University | 2025
